BUILD-22 Truncated Domes

“Truncated domes” is a term denoting tactile warning strips made of composite materials that have a series of small raised “nubs” which look like a dome with the top cut off or “a dome which is truncated.” These strips can be used as tactile warning devices by the visually impaired.

The U.S. Department of Justice (DOJ), the agency responsible for administering “The Americans with Disabilities Act of 1990” (ADA), published an “Americans with Disabilities Act Accessible Guideline” or (ADAAG) which is the basis for the ICC/ANSI A117.1 2003, Section 705 that we are required to enforce.

This policy is being published to notify our customers that **truncated domes as specified in ICC ANSI A117.1 2003 will again be required.**
