W.O. No. 2017-1939

City of Spokane Department of Engineering Services 801 W. Spokane Falls Boulevard Spokane, WA 99201

Attn: Inga Note, P.E.

Re: Proposed Greenstone - Sonneland PUD

31<sup>st</sup> Avenue & Crestline Street Traffic (Trip) Distribution Letter

Dear Inga,

The purpose of this document is to provide a Trip Generation and Distribution letter (TGDL) for the proposed Sonneland PUD and Community Retail project, located in the vicinity of 31<sup>st</sup> Avenue & Crestline Street and north to 29<sup>th</sup> Avenue, as shown on Figure 2 Concept Site Plan. This letter will follow the standards for doing Trip Distribution Letters as required by the City of Spokane and the Institute of Transportation Engineers (ITE).

# **PROJECT DESCRIPTION**

The project proposes to develop approximately 19.59± acres of undeveloped land into the proposed Sonneland PUD and Community retail development project, a concept development plan is attached and is anticipated to include the following land uses.

**Table 1 Concept Land Uses** 

Land Use	Units/ GFA		ITE Land Use Code
Multi-Family Residential	200 units	220	Apartments
Single Family Residential	50 units	210	Single Family – Detached Housing
Walk-up Coffee Shop	2,500 sf	936	Coffee/Donut Shop Without Drive Thru
Retail Strip Mall	17,500 sf	826	Specialty Retail

Per the concept plan, it is proposed that 31<sup>st</sup> Avenue be extended from Southeast Boulevard to an extension of Crestline Street. It is also proposed that 30<sup>th</sup> Avenue be extended to the Stone Street alignment as a private site driveway/access road. Additionally, a new north-south connecting road (Clubhouse Drive) be built between 30<sup>th</sup> and 31<sup>st</sup> Avenues for additional internal connectivity. The proposed residential and commercial landuses are intended to make driveway connections to these proposed street extensions or existing streets. As shown in Figure 2, Concept Site Plan.

# VICINITY / SITE PLAN

The site is currently listed on the Comprehensive Plan as Residential Single Family (RSF), and Center and Corridors, District Center, with pedestrian emphasis and auto accommodating. The

City of Spokane Greenstone Sonneland PUD & Community Retail January 3, 2018 Page 2 of 11

subject properties lies on the N ½ of Section 33, T.25N., R.43E., W.M. within the City of Spokane, Washington. The parcel numbers for the site are shown on Table 2. A vicinity map is included as Figure 1 and an exhibit of the subject property is included as Figure 2, per Spokane County Scout.

Table 2 Subject Properties Parcels, Area, and Land Use

Parcel #	Area (sf)	Existing Land Use	Parcel #	Area (sf)	Existing Land Use	Parcel #	Area (sf)	Existing Land Use
35332.3102	25,200	RSF	35332.3103	25,260	RSF	35332.3101	20,500	RSF

<sup>\*</sup>Areas Per Spokane County Auditor

#### City of Spokane Comprehensive Plan

With the projects extension of Crestline Street, a designated collector arterial, and the extension of 31<sup>st</sup> Avenue from Crestline Street to Southeast Boulevard identified in the COS Comprehensive Plan an arterial route connection will be completed. This route will provide some relief to Regal and Perry Streets while not disrupting the traffic flow patterns of 29<sup>th</sup> Avenue with another traffic signal that would be in close proximity to the signal at Southeast Boulevard.

#### **Local Access Relief**

With the extension of 30<sup>th</sup> Avenue east from Martin Street and connection of Clubhouse Drive between 30<sup>th</sup> and 31<sup>st</sup> Avenues. The local residents will now have an alternate route than 29<sup>th</sup> Avenue which should also provide some relief at the Grapetree development. Additional relief may be found for those adjacent residents on 32<sup>nd</sup> Avenue.

#### Trough Travel Estimation (Influence Area).

With any roadway there is an area of influence, or an area that will use the roadway. This area can be small like a local access road or larger for a collector arterial with many local access roads connecting to it. In this case we believe that the proposed connection of Crestline and 31<sup>st</sup> to Southeast Boulevard will have an influence area between Napa and Cook Streets and from 29<sup>th</sup> Avenue to 44<sup>th</sup> Avenue.

This area of influence includes approximately 422 residential lots. Although many or all of the residents may try the new roadway it is anticipated that only about 30% of drivers will get a specific identifiable result, in order to change their commute. Considering that a left turn is the most difficult turn to complete at an unsignalized intersection it is assumed that the eastbound left turn at the intersection of 31<sup>st</sup> Avenue & Southeast Boulevard will be a deterrent.

City of Spokane Greenstone Sonneland PUD & Community Retail January 3, 2018 Page 3 of 11

It is anticipated that a trip with a southwest direction of travel to the influence area would most likely redirect their standard commute on Regal Street and 37<sup>th</sup> and utilize the 31<sup>st</sup> and Crestline connection. This is ideally a trip from I-90 that moves up Ray Street to 29<sup>th</sup> Avenue and instead of turning at Regal Street (before the area), or at Perry Street (after the area) they would turn at Southeast Boulevard and then turn onto 31<sup>st</sup> Avenue.

In the AM peak hour we do not believe that there is any benefit for trips to go north on Crestline Street to 31<sup>st</sup>

Avenue as they would have to turn left onto Southeast Boulevard. But there are those that will choose that route, therefore we anticipate about 25 to 50 trips from Regal and Perry Streets to be redirected down Crestline Street and 31<sup>st</sup> Avenue.

In the PM peak hour there is a greater potential for trips to utilize the new connection as the movement on is primarily a right turn as trips come from the east and from the north. Therefore, we estimate that as many as 125 to 150 trips from Regal and Perry Streets will be redirected to the new connection of Crestline.

Overall it is important to remember that these trips are already being generated and that one's neighbor will still be doing the same trip at the same time. It just maybe a little different as the new roadway (Crestline) opens and commuters move to the new roadway and their original space on Regal or Perry Streets will be filled by someone else. This is as we understand a natural occurrence on todays transportation system. As drivers find balance in the system that suits their need. For example, if a driver knows that during their morning commute they go past a school and that there is a 15-minute period when the intersection in front of the school is congested then they will either leave early or late in order to avoid that congestion. This is the natural balance of an individual, but what is traffic but a group of individuals that make choices based upon the information that they have, (Time, Destination, Route) and the information presented to them (Alternate route, Congestion, Time). All of this is a specific identifiable result that can make the difference in the number of trips that will travel through on Crestline.

City of Spokane Greenstone Sonneland PUD & Community Retail January 3, 2018 Page 4 of 11

# TRIP GENERATION AND DISTRIBUTION

#### **Trip Types**

The proposed land uses will be evaluated as residential and commercial; ITE has developed data regarding various trip types that all developments experience. These are found in several places, however, for this analysis the *Trip Generation Manual 8<sup>th</sup> Edition* as well as the Institute of transportation Engineers (ITE) *Trip Generation Handbook* were used to develop the criteria for this analysis.

Generally all existing and proposed developments will be made up of one or more of the following four trip types: new (destination) trips, pass-by trips, diverted trips, and shared (internal trips). In order to better understand the trip types available for land access a description of each specific trip type follows.

**New (Destination) Trips** - These types of trips occur only to access a specific land use such as a new retail development or a new residential subdivision. These types of trips will travel to and from the new site and a single other destination such as home or work. This is the only trip type that will result in a net increase in the total amount of traffic within the study area. The reason primarily is that these trips represent planned trips to a specific destination that never took trips to that part of the City prior to the development being constructed and occupied. This project will develop new trips.

Pass-by Trips - These trips represent vehicles which currently use adjacent roadways providing primary access to new land uses or projects and are trips of convenience. These trips, however, have an ultimate destination other than the project in question. They should be viewed as customers who stop in on their way home from work. An example would be on payday, where an individual generally drives by their bank every day without stopping, except on payday. On that day, this driver would drive into the bank, perform the prerequisite banking and then continue on home. In this example, the trip started from work with a destination of home, however on the way, the driver stopped at the grocery store/latte stand and/or bank directly adjacent to their path. Pass-by trips are most always associated with commercial/retail types of development along major roadways. Therefore, for this project pass-by trips will be considered.

Shared / Internal / Trips - These are trips which occur on the site where a vehicle/ consumer/ tenant will stop at more than one place on the site. For example, someone destined for a certain shop at a commercial site may stop at a bank just before or after they visit the shop that they went to the site to visit. This trip type reduces the number of new trips generated on the public road system and is most commonly used for commercial developments. These trips are anticipated and will be being accounted for.

#### Trip Generation Characteristics for the Concept land uses

As noted earlier, trip generation rates for the AM and PM peak hours are determined by the use of the *Trip Generation Manual*, 9<sup>th</sup> Edition published by the Institute of Transportation Engineers (ITE). The purpose of the *Trip Generation Manual* is to compile and quantify empirical data into trip generation rates for specific land uses within the US, UK and Canada.

For the proposed 200 units of Multi-Family Residential units, Land Use Code (LUC) 220 Apartment was used to anticipate the trip generation of the proposed use. The AM and PM peak hour trip generation for LUC 220 are shown on the following table with the anticipated average daily trips to/from the site.

Table 3 - Trip Generation Rates for LUC 220 Apartment

	- AMP	eak Hour	Trips	PM Peak Hour Trips			
<b>Dwelling Units</b>	Vol. @ 0.51 trips/	0.51 trips/ Distribution		tribution 0.62 trips/		Directional Distribution

50	9.52		476				

City of Spokane Greenstone Sonneland PUD & Community Retail January 3, 2018 Page 6 of 11

For the proposed 2,500 sf (2.5 ksf) Walk-up Coffee Shop, Land Use Code (LUC) 936 Coffee/Donut Shop without Drive through Window was used to anticipate the trip generation of the proposed use. The AM and PM peak hour trip generation for LUC 936 are shown on the following table with the anticipated average daily trips to/from the site.

Table 5 - Trip Generation Rates for LUC 936 Coffee/Donut Shop W/O Drive thru Window

	AM I	eak Hour	Trips	PM P	PM Peak Hour Trips

City of Spokane Greenstone Sonneland PUD & Community Retail January 3, 2018 Page 7 of 11

#### **Development Trip Summaries**

#### Internal/Shared Trip Summary

This mixed-use development is anticipated to have internal or shared trips between the land uses or group of land uses. For example, someone destined for a certain entity/business at a commercial site may stop at a business entity, just before or after they visit their intended destination on site. Likewise, a resident within a mixed-use development may stop at a shop before going on to the public road system, for example to get a coffee, or a soft drink. This trip type reduces the number of new trips generated on the public road system and is most common within mixed use developments. Generally internal trip capture is 15 to 30% of a developments trip generation for a mixed-use development.

The Institute of Transportation Engineers Trip Generation Handbook outlines a method to quantify the internal trips within chapter 7. ITE does include warnings of its limitations and its use. It is the purpose of these guidelines to determine an internal trip generation that best fits the relationship of a mixed-use development. An example of this is that the chapter 7 tables do not include any data for the AM peak hour, yet we know from experience that internal trips between the land uses will occur (hence, the coffee/soda example previously given), so an engineering judgement must be made to represent this relationship. For this analysis when AM internal/shared trip data is not available, it was decided that the AM percentage should be 50%, or half of the PM internal/shared trip data.

As shown in the internal trip generation worksheet included in the appendix, In the AM peak hour 27 internal trips are captured within the proposed projects uses which results in a 7% capture (27/411) In the PM peak hour 85 internal trips are captured by the proposed projects uses, which result in a 26% internal capture (85/324).

#### Pass-by Trip Summary

Pass-by trips are those trips that are already on the neighboring roadways and they turn into the proposed project uses before continuing their trip to their destination. While these pass-by trips occur at the driveways they are not a new trip and do not add to the traffic volumes of the transportation system. Table 7 shows a summary of the pass-by trips anticipated to be generated by the commercial uses of the project.

Table 7 – Development Pass-by Trip Generation Summary

	AM Peak Hour Trips			PM Peak Hour Trips			
Land Use Code	Per LUC	Direct Distrib		Per	Directional Distribution		
	LUC	In	Out	LUC	In	Out	
LUC 936 Coffee/Donut Shop W/O Dr. Thru	129	63	66	36	18	18	
LUC 826 Specialty Retail				5	3	2	
Total	129	63	66	41	21	20	

City of Spokane Greenstone Sonneland PUD & Community Retail January 3, 2018 Page 8 of 11

As shown on Table 7 there are 129 Pass-by trips anticipated in the AM peak hour with 63 pass-by trips entering the site and 66 pass-by trips exiting the site. In the PM peak hour there are 41 Pass-by trips anticipated, with 21 pass-by trips entering the site and 20 pass-by trips exiting the site

# **Driveway/New Trip Summary**

The traffic to/from this site would be made up of new (destination) trips. Table 8 shows a summary of the anticipated new trips that will be generated by the Retail and Apartment uses. These new trips will add to the traffic volumes of transportation system.

Table 8 – Development New Trip Generation Summary

	AM	Peak H Trips	lour	PM Peak Hour Trips		
Land Use Code	Per	Distribut		Per	Directional Distribution	
	LUC	In	Out	LUC	In	Out
LUC 220 Apartment	94	27	77	104	70	34
LUC 210 Single Family Detached Housing	C 210 Single Family Detached Housing 32 10		22	37	23	14
LUC 936 Coffee/Donut Shop W/O Dr. Thru	129	63	66	37	18	19

Total	255	100	165	198	121	77
Average Daily	Γrip End	ls (ADT	)			
Land Use Code	Rate	ADT				
LUC 220 Apartment		1,330	)			
LUC 210 Single Family Detached Housing		476				
LUC 936 Coffee/Donut Shop W/O Dr. Thru		1,019				
LUC 826 Specialty Retail		776				
Total		3,601				

As shown on Table 8 In the AM Peak hour the development is anticipated to generate a total of 255 new trips with 100 new trips entering the site and 165 new trips exiting the site. In the PM peak hour 198 new trips are anticipated with 121 new trips entering the site and 77 new trips exiting the site. Please see Figures 3 & 4 for a distribution of these trips on the transportation system.

City of Spokane Greenstone Sonneland PUD & Community Retail January 3, 2018 Page 9 of 11

### Overall Summary of Landuses

Table 9 summarizes the total number of anticipated trips that enter and exit the site during the AM and PM peak hours. These are trips that register at the proposed project driveways.

Table 9 – Overall Development Trip Generation Summary

		v				
	AM	Peak H Trips	PM Peak Hour Trips			
Land Use Code	Per	Directional Distribution		Per	Directional Distribution	
	LUC	In	Out	LUC	In	Out
Table 8, Total New Trips	255	100	165	198	121	77
Table 7, Total Pass-by Trips	129	63	66	41	21	20
Total Overall	384	163	231	239	142	97

As shown on Table 9 In the AM Peak hour the development is anticipated to generate a total of 384 trips with 163 trips entering the site and 231 trips exiting the site. In the PM peak hour 239 trips are anticipated with 142 trips entering the site and 97 trips exiting the site.

City of Spokane Greenstone Sonneland PUD & Community Retail January 3, 2018 Page 10 of 11

# TRIP DISTRIBUTION

The overall transportation network in this area consists of a principle arterial, a minor arterial, collectors, and local access roads. As shown on the concept site plan the development is to be accessed via public roadways connecting to; 29<sup>th</sup> Avenue at the intersection of Martin Street and connecting to Southeast Boulevard at 31<sup>st</sup> Avenue and connecting to South Crestline Street, at 32<sup>nd</sup> Avenue.

<u>31<sup>st</sup> Avenue</u> is a short east-west, two-way, local access road that extends west from Cook Street to Southeast Boulevard. The project proposes extending the roadway to Crestline Street. 31<sup>st</sup> Avenue currently serves the STA park and ride. The speed limit on 31<sup>st</sup> Avenue is 25 MPH.

<u>Southeast Boulevard</u> is generally a north-south, two-way, two-lane Minor arterial that extends from Sherman Street to Regal Street. Southeast Boulevard generally serves residential uses along the north face of the South Hill, and commercial uses near the intersection of Southeast Boulevard & 29<sup>th</sup> Avenue. The speed limit on Southeast Boulevard is 30 MPH.

<u>Crestline Street</u> is a north-south two-way two-lane neighborhood collector that extends from 37<sup>th</sup> Avenue to 63<sup>rd</sup> Avenue. Crestline is surrounded by residential uses. The speed limit on Crestline Street is 25 MPH.

The distribution of the additional new trips of the proposed land uses are anticipated to distribute onto the existing transportation system as follows: it is anticipated that 30% of the trips will travel to/from the north, 40% will go to/from the south, 10% will go to/from the Lincoln Heights Shopping Center, 10% will go to/from the east via 29<sup>th</sup> Avenue, and 10% will go to/from the west on 29<sup>th</sup> Avenue.

For the 30% of trips traveling north, it is anticipated that 15% of the trips will go to/from Interstate 90 via Ray Street, 5% of the trips will go to the Perry and University Districts via Southeast Boulevard, and 15% of the trips will go to/from the downtown area via 29<sup>th</sup> Avenue and Grand Boulevard.

For the 40% of trips traveling south it is anticipated that 20% of the trips will go to/from the south via Regal Street, 15% will go to/from the south via Crestline Street, and 5% will go to/from the south via Perry Street.

The above-mentioned traffic distribution percentages are based on engineering judgment and actual traffic observations.

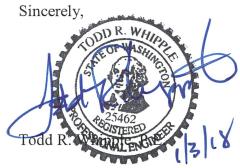

City of Spokane Greenstone Sonneland PUD & Community Retail January 3, 2018 Page 11 of 11

# **CONCLUSIONS AND RECOMMENDATIONS**

It is anticipated that this project will generate 255 new AM peak hour trips and 198 new PM peak hour trips on the transportation system.

Based upon the location of the project, the number of anticipated trips, the distribution of those trips on the surrounding network of public roadway. We believe that the proposed project while adding trips to local intersections, will not reduce the intersections in the immediate area below an acceptable level of service. Therefore, we recommend that the project be allowed to move forward without further traffic analysis.

Should you have any questions related to this document please do not hesitate to call at 893-2617.
