Appendix V - Contaminants found in Drinking Water Testing in 2019 .......................................... 19
Executive Summary

Spokane’s drinking water meets or exceeds all State and Federal drinking water quality standards. This annual report prepared by the City of Spokane’s Water Department supports and informs our Water Department annual Consumer Confidence Report, distributed as the City of Spokane Water Quality Report. This report provides wholesale water customers, businesses and the public with a more detailed discussion, with additional references, a complete list of the year’s testing, and thorough consideration on the reasons for testing.

The City tested for 35 different inorganic parameters. There were detections of arsenic and nitrate.

The drinking water was tested for 64 organic compounds, and none were detected.

Radionuclide testing revealed levels of gross alpha emitters, Radium 228, and radon in the drinking water.

The City disinfects the drinking water with chlorine gas, resulting in the generation of low concentrations of disinfection byproducts. The city tests for nine of these compounds quarterly. There were detections at the farthest reaches of the distribution system.

The City tests both the source water and the distribution system for microbiological contaminants. In 2019, there were no detections of total coliform in the distribution system during routine regulatory sampling.

On Friday, July 26, 2019, hydroseed was inadvertently injected into the distribution system by a third party. This resulted in a health advisory to not drink or cook with the water for over 100 homes in the Hillyard area. There were multiple detections of total coliform and e. coli during this event. The health advisory was in effect for five full days. The distribution system was flushed out for several days. After two rounds of bacterial testing with no detections of total coliform the health advisory was lifted on Wednesday, July 31.

The following narrative and attachments summarize and explain recent results in more detail. Appendix V and the last two pages of this narrative (General Information) contain information relevant to the annual Consumer Confidence Report. As such, the information may be redundant relative to the main text of this report.

The detections mentioned are below applicable drinking water standards. The results were within the range of results from previous testing. Arsenic and radionuclides, including radon, are from naturally occurring geological sources. Nitrate is primarily from anthropogenic sources such as fertilizer and septic systems, but has declined in recent years with the conversion of individual septic systems to centralized sewer systems.
Introduction and Source Water Information

All of the City of Spokane’s drinking water comes from the Spokane Valley-Rathdrum Prairie Aquifer - designated a sole source aquifer in 1978. The Spokane Valley-Rathdrum Prairie Aquifer slowly flows through two different states and a number of different counties and is the source water for a large number of water purveyors, including the City of Spokane. This water and any contaminants freely move across political boundaries. Many groups and/or private individuals may claim this water to be used for diverse purposes. Some of these competing interests include (but are not limited to) drinking water rights, irrigation, fisheries, hydroelectric power, and industrial processes. The Spokane Aquifer (that portion of the larger aquifer lying within Washington State) and the Spokane River exchange water. While the aquifer contains a large volume of water, many factors play into the volume of water in the Spokane River, complicating the management of these resources. Some of these factors include pumping for irrigation and potable water, hydroelectric dam operations, and the variations of weather and precipitation. Learn more about the Spokane Valley-Rathdrum Prairie Aquifer by downloading the Aquifer Atlas from www.spokanecounty.org/1227/SVRP-Aquifer-Home

The City of Spokane's Water Department delivers up to 180 million gallons of clean, safe drinking water every day to more than 220,000 people in our community. The City's water system is the third largest in the state of Washington, behind Seattle and Tacoma. Our water system includes pumps, reservoirs, seven source wells, and more than 1,000 miles of water mains and smaller water lines that bring water from our wells to homes and businesses.

Due to the porous nature of the ground surface and the number of potential contaminant sources, the possibility of contaminating the aquifer exists if good housekeeping measures are not followed for all activity over and adjacent to the aquifer. The physical and economic health of our area depends on the quality of our drinking water. In order to safeguard water quality, the City continues its efforts to make available to the community information about, and appropriate disposal mechanisms for, dangerous wastes that are generated in the Aquifer Sensitive Area. The City, in cooperation with other local governments and the Spokane Aquifer Joint Board, continues to work toward strengthening regulations for the storage and use of critical materials to safeguard the local water supply.

Table 1 List of Resources
QUALITY Drinking Water
An Invaluable Community Resource

INORGANICS

The City typically has a Washington State Department of Ecology accredited laboratory run a full drinking water inorganics analysis once every three years on each of our source wells. In addition, nitrates are tested annually, as required. The most recent inorganic results from accredited laboratories are in Appendix III. All sources are in compliance with existing National Primary Drinking Water Regulations for Inorganic Maximum Contaminant Levels (MCL).

ARSENIC

The arsenic readings in 2019 at the Central, and Well Electric wells were 3.55 µg/L, and 4.74 µg/L respectively. The MCL for arsenic is 10 µg/L, or parts per billion (ppb). For City drinking water, 5.13 µg/L of arsenic in 2009 from Ray Street Well represents the highest result to date.

City drinking water currently meets EPA’s drinking water standard for arsenic. However, it does contain low levels of arsenic. EPA’s standard balances the current understanding of arsenic’s health effects against the cost of removing arsenic from drinking water. EPA continues to research the health effects of low levels of arsenic, which is a mineral known to cause cancer in humans at high concentrations and is linked to other health effects such as skin damage and circulatory problems.

Further information concerning health impact issues, regulatory requirements, and compliance costs for water utilities/water customers can be found at www.doh.wa.gov/Portals/1/Documents/Pubs/331-167.pdf.

LEAD - COPPER

Lead and copper testing of sources and at-risk residences were conducted in 2018. The highest reading of lead in a home was 3.58 µg/L (ppb). The maximum reading for copper was 154 µg/L. These results for lead and copper continue to be less than the 15 µg/L Action Level for lead and the 1300 µg/L Action Level for copper. The lead results, based on City in-home sampling, also continue to qualify our water system as having “Optimized Corrosion Control.”

City drinking water currently meets EPA’s drinking water standards for lead and copper. The EPA standard for lead balances the current understanding of lead health effects against the effectiveness and cost of corrosion control processes. The EPA is currently reassessing standards for lead.

In July of 2018, the City completed its’ program to remove the remaining lead service lines in the City’s water system. In May 2016, the City initiated a project to eliminate the final 486 lead service lines. City records indicate that originally some 981 homes built during World War II were connected to the City’s distribution system with lead alloy pipes. In addition, before lead solder was banned in 1988, it was commonly used to connect copper piping in homes.

Sampling methods require testing water left sitting in lead-containing pipes for at least 6 hours. This results in a worst-case scenario for lead to move into the water. The City encourages anyone with this kind of plumbing, drawing water for cooking or drinking purposes, to let water run from the tap until cold before filling their container, especially if the water is to be given to infants or children.

For further information concerning lead in drinking water, you can find further information at www.doh.wa.gov/CommunityandEnvironment/DrinkingWater/Contaminants/Lead.
Further information about copper in drinking water can be found at www.doh.wa.gov/CommunityandEnvironment/DrinkingWater/Contaminants/Copper

Drinking water is only one of many potential sources of exposure to lead. An EPA publication titled “Protect Your Family From Lead In Your Home” can be downloaded from https://www.epa.gov/lead/protect-your-family-lead-your-home.

NITRATE - NITROGEN

The Ray Street Well continues to be monitored quarterly for Nitrate-N. **In 2019, the highest accredited lab quarterly result for the Ray Street Well was 3.32 mg/L, or parts per million (ppm).** The federal MCL for Nitrate –N is 10 mg/L. The result from a duplicate sample analyzed by the Riverside Park Water Reclamation Facility (RPWRF) Laboratory was 3.34 mg/L. The quarterly results for Ray Street Well for 2019 are as follows:

<table>

Table 3 City Source Well Nitrate levels

The following map depicts the results of monitoring wells sampled during 2019 by the Spokane County Water Resources Program. The results are for nitrate+nitrite as nitrogen from monitoring wells and springs along the Spokane River and purveyor wells over the Spokane Aquifer. Where multiple sampling events occurred at the same location, the highest result is depicted on the map. There are a number of wells that had results between 2.51 and 5.95 mg/L. These wells, including the City of Spokane Ray Street Well, are typically located along the edge of the aquifer and appear to be subject to nitrate loading to the aquifer that originates at higher elevations.
Figure 1 Aquifer Nitrate level

For further information concerning nitrate in drinking water and potential health issues, you can access the Washington State Dept. of Health website at www.doh.wa.gov/Portals/1/Documents/Pubs/331-214.pdf.

RADIONUCLIDES & RADON

RADIONUCLIDES

In 2019, the City of Spokane tested the Central, Hoffman, and Nevada source wells for Radium 228 and Gross Alpha. The table below has the results.

<table>
<thead>
<tr>
<th>Source</th>
<th>Gross Alpha Particle Activity</th>
<th>Radium 228</th>
<th>Combined Radium 226/228 *</th>
</tr>
</thead>

</tr>
<tr>
<td>MCL</td>
<td>15</td>
<td></td>
<td>5</td>
</tr>
</tbody>
</table>

Table 4 Radionuclide Results
All results in picocuries per liter (pCi/L)

Gross Alpha particle activity has an MCL of 15 pCi/L. The federal MCL for Radium 226 and Radium 228 (combined) is 5 pCi/L. **The City of Spokane results were below the MCL.**

The radionuclide rule allows Gross Alpha results to be used in lieu of Radium 226 if the Gross Alpha particle activity is below 5 pCi/L. If the gross alpha particle activity result is below the detection limit, one-half of the detection limit is used to determine compliance¹. The radionuclide rule also allows a Gross Alpha particle activity measurement to be substituted for the required uranium measurement provided that the measured gross alpha particle activity does not exceed 15 pCi/L. The Gross Alpha activity was below 15 pCi/L so the City did not test for Uranium.

* If the Radium 228 or 226 value is <1.0, a value of zero will be used to calculate the Combined Radium 226/228².

**RADON**

The Water Department monitored the Central, Hoffman and Nevada wells for radon in 2019, with results of 350 pCi/L, 400 pCi/L and 350 pCi/L respectively.

The Environmental Protection Agency has published a proposed rule for regulating the concentration of radon-222 in drinking water. The rule proposes a maximum contaminant level goal (MCLG) of zero, a maximum contaminant level (MCL) of 300 pCi/L, and an alternative maximum contaminant level (AMCL) of 4000 pCi/L.

Comments for the proposed rule were accepted until February 4, 2000; however no final rule was promulgated and at the current time this regulatory action is not on the EPA agenda list.

Currently, water purveyors are required to inform their customers of known results for Radon-22 testing, which the City of Spokane voluntarily monitors.

Radon gas is one of a number of radioactive elements that result from the radioactive decay of uranium found locally in natural deposits. Exposure to excessive amounts of radon may increase cancer risk. Most of these risks result from exposure to radon in indoor air. The EPA has determined that 1-2% of the radon in indoor air comes from drinking water. General information concerning radon in the environment and the associated health issues, including drinking water, can be found at [www.epa.gov/radon](http://www.epa.gov/radon) or call the Radon Hotline at 1-800-SOS-RADON [1-800-767-7236]. An EPA publication titled “A Citizen’s Guide to Radon” can be downloaded from [www.epa.gov/radon/citizens-guide-radon-guide-protecting-yourself-and-your-family-radon](http://www.epa.gov/radon/citizens-guide-radon-guide-protecting-yourself-and-your-family-radon). The EPA has published a National Radon Action Plan ([https://www.epa.gov/radon/national-radon-action-plan-strategy-saving-lives](https://www.epa.gov/radon/national-radon-action-plan-strategy-saving-lives)) to more broadly mitigate Radon exposure.
ORGANICS

DISINFECTION BY-PRODUCTS – DISTRIBUTION SYSTEM

The maximum value during 2019 compliance monitoring of the distribution system for total trihalomethanes (TTHM) was 3.57 µg/L and for haloacetic acids (HAA5) was no detection. This is well below the federal MCL of 80 µg/L for total trihalomethanes and 60 µg/L for the sum of five haloacetic acids. The by-products are only detected at the extreme end of the distribution system. The Stage 2 Disinfectants and Disinfection By-products Rule requires a Locational Running Annual Average (LRAA) be used for reporting compliance. This is the average of four quarterly samples for each sampling location. The City uses small amounts of chlorine as a drinking water disinfectant. However, the disinfectants themselves can react with materials in the water to form byproducts, which may pose health risks. The maximum value for TTHM was 3.62 µg/L. Appendix IV has the results for all 2019 quarterly sampling. There were no detections of haloacetic acids at any sampling site in 2019.

In 2019, two sites were sampled every quarter. They were Eagle Ridge Two, and Southview. For more information on the Stage 2 Disinfection and Distribution By-Product Rule (DPBR), go to the EPA website water.epa.gov/lawsregs/rulesregs/sdwa/stage2/index.cfm

2019 was the ninth year of sampling under the Stage 2 DPBPR. Starting in 2007 and continuing until 2010, the City Water Department performed assessment monitoring at over 20 locations (approximately five each year) to determine the potential for disinfection by-products (DBP) to be formed during the detention period in the distribution system. The DBP assessment sampling sites were selected from the existing coliform sampling sites. Based on this sampling and analysis of the retention time of water in the distribution system, locations were determined for the Stage 2 distribution system sampling program.

Figure 2 Disinfection Byproduct Monitoring Sites
VOLATILE ORGANICS

In 2019, the City of Spokane tested the Grace and Hoffman well stations for Volatile Organic Compounds (VOC). There were no detections. A complete list of the chemicals analyzed is in Appendix I.

Trihalomethanes (THMs, chloroform, bromoform, bromodichloromethane, dibromochloromethane) are one group of volatile organic, disinfection by-products. That is to say, they can originate from chemical interactions between a disinfectant (chlorine gas in the City’s system) and any organic matter present in the raw water. There were no detections of THMs in source water monitoring for 2019.

SYNTHETIC ORGANICS

The City of Spokane did not sample for Synthetic Organic Chemicals (SOC’s) in 2019. The City of Spokane tests all of the wells on a three-year cycle. 2020 and 2021 are scheduled for the next sampling cycle.

MICROBIOLOGICAL CONTAMINANTS

HILLYARD INCIDENT

The City’s Water Department in 2019 and early 2020 led an effort to update the City’s hydrant permit program and hydrant use policies to enhance hydrant security, ensure use of necessary equipment to protect the water supply, and appropriately account for water use. The program also is designed to complement additional hydrant security measures that are being evaluated, including the installation of hydrant locks and water fill stations.

The Spokane City Council approved the updated hydrant permit program in late January 2020, which requires the use of City backflow prevention devices and also includes penalties for non-compliance.

The revised program developed following a water contamination problem in the Hillyard area in the summer of 2019. On July 26, customers began calling the Water Department at about 9 a.m. to report green fibrous material in their tap water. Water department staff began investigating and found the same material around a fire hydrant near Florida and Wellesley.

Water Samples were collected from businesses and fire hydrants in the area. The material was determined to be hydroseed. This is cellulose fiber and grass seed mixture that is mixed in water and sprayed on bare ground to establish lawns. Safety Data Sheets were obtained for the substance. While water quality staff and inspectors were collecting samples, other water department crews began opening hydrants and looking for the fiber material and closing valves to isolate the system. An area bounded by Wellesley on the south, Crown Avenue on the north, Freya on the west, and Havana on the east was isolated to contain the contamination.

A health advisory to not drink or cook with water in the isolated area was issued by the City. The Washington State Department of Health was notified, and the City and DOH worked together collaboratively throughout the incident.

Collected water samples were sent to a local analytical laboratory for the analysis of volatile organic chemicals, total suspended solids, nitrate, phosphorous, potassium, and Coliform. The analysis of these samples indicated there were no detectable levels of organic chemicals, such as pesticides, and normal levels of nitrate, phosphorous and potassium. Samples were also analyzed for coliform bacteria at the City Water Quality Laboratory. One sample collected from outside of the isolated area tested positive for total coliform bacteria, this sample was determined to be a false positive, provided to the Water Quality Supervisor several hours after the sample was taken and did not follow proper sampling protocol. One sample collected within the isolated area tested positive for total coliform, and three samples collected within the isolated area had indications of total coliform and e. coli.

Unidirectional flushing was started on Friday afternoon within the isolated area and continued throughout the night to Saturday morning. More coliform samples were collected from both within the isolated area and outside of the isolated
area. One sample from within the isolated area tested positive for coliform bacteria. Of all the samples collected on Saturday, there were no detections of e. coli. Based on the total coliform result a section of water main along Myrtle Street was isolated, chlorinated, and flushed extensively on Sunday. During this time, the water meters for all of the customers in the isolated area were removed, cleaned and replaced. More sampling was conducted on Monday and Tuesday. There were no indications of coliform bacteria in these samples. The health advisory was lifted on Wednesday.

For more information on cross connection control and back flow prevention, you can go to https://www.doh.wa.gov/CommunityandEnvironment/DrinkingWater/WaterSystemDesignandPlanning/CrossConnectionControlBackflowPrevention

**COLIFORM BACTERIA - SOURCE**

The City of Spokane well station raw source water (the water before disinfectant chlorination) has been tested regularly for coliform bacteria. While historically there has been no requirement to test for coliform bacteria in source water, the City has monitored for this water quality parameter. More recently, testing requirements to determine whether hydraulic continuity exists with the Spokane River have increased the testing frequency. **In 2019, out of 67 tests for coliform bacteria in the City source water wells, there were no detections of total coliform and no detections of fecal coliform.**

Out of 393 tests over the five-year period from 2015 through 2019, there have been no detections of total coliform. There have been no detections of fecal coliform in the source water during this time frame.

**HETEROTROPHIC PLATE COUNT BACTERIA – SOURCE**

In 2019, out of 67 Heterotrophic Plate Count (HPC) tests on source water, there were 8 positive results. The greatest concentration was 4 colonies per milliliter of sample at the Central Well. HPC tests were conducted 371 times over the five-year period from 2015 through 2019 on raw source water. There have been 76 positive HPC results. The maximum detection during this five-year period was 681 colonies per milliliter at the Hoffman Well in 2015. Without regard to source water HPC levels, City source water is treated with chlorine to safeguard drinking water quality. This is done based on the historical use of open reservoirs (which no longer exist) and to preserve the sanitary quality when a well or piping is open to the environment during construction, repair or routine maintenance. Some water utilities in this area (drawing from the same aquifer) do not add any disinfectant.

**COLIFORM BACTERIA - DISTRIBUTION SYSTEM**

Coliform testing is typically done four days a week from various points in the distribution system. The Water Department has more than 220,000 customers. This population tier³ requires taking 150 samples per month, which was adopted as the target for distribution system coliform monitoring by the Water Department in 2007. When a coliform positive test result is reported, re-sampling is done in compliance with the Total Coliform Rule and the Groundwater Rule. **During 2019, the City Water Department had 1,980 coliform bacteria samples analyzed.** 1,992 coliform bacteria samples were analyzed in 2018 and, 1,972 samples were analyzed in 2017.

The Water Department staff has worked to refine the sampling sites for the distribution system. Concerns about inadvertent contamination of sampling sites and locations that don’t adequately represent the distribution of the water system has caused the Water Department staff to establish more dedicated sampling sites at locations more representative of the entire system. **Following is a map of the distribution system sampling sites during 2019, overlaid on the City’s water service area. It is important to note that the sample sites are evenly placed based on the distribution system, which may not currently reach all parts of the water service area, and population density.**

---

³ Ref. WAC 246-290-300 (3)(e-Table 2)
A number of cities and towns throughout the country, in years past, have experienced problems with giardia and/or cryptosporidium getting into the distribution systems. Most times, problems with these parasitic organisms in potable water have been associated with surface water sources. The City is not aware of, nor has the State Department of Health or Spokane Regional Health District indicated an awareness of, cases where infections with these organisms were traced back to the City’s water system.

Please note that cryptosporidium and other water borne organisms can be spread in many ways. People who become ill as a result of consuming giardia and/or cryptosporidium typically recover after suffering severe bouts of diarrhea. However, small children, people whose immune systems are compromised, or those who are otherwise in poor health can die as a result of these infections. For further information concerning the potential health effects issues, access the websites at the CDC at [www.cdc.gov/parasites/crypto/index.html](http://www.cdc.gov/parasites/crypto/index.html) (cryptosporidium) and [www.cdc.gov/parasites/giardia/index.html](http://www.cdc.gov/parasites/giardia/index.html) (giardia).
GENERAL INFORMATION

Across the nation, the sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and radioactive material and can pick up substances resulting from the presence of animals or human activity.

Contaminants that may be present in source water include:
- Biological contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban storm water run-off, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides, which may come from a variety of sources such as agriculture, storm water run-off, and residential uses.
- Organic chemicals, including synthetic and volatile organics, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm water run-off and septic systems.
- Radioactive materials, which can be naturally occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, the Environmental Protection Agency (EPA) prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. Food & Drug Administration (FDA) regulations establish limits for contaminants in bottled water, which must provide the same protections for public health.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by contacting the Environmental Protection Agency’s Safe Drinking Water Hotline (1-800-426-4791), on line at www.epa.gov/your-drinking-water/safe-drinking-water-hotline, or you can access additional information at EPA website: www.epa.gov/your-drinking-water

HEALTH INFORMATION

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

Additional information concerning:

Radon: During 2019, the City conducted tests at Central, Hoffman and Nevada wells for Radon-222. The results were 350 pCi/L, 400 pCi/L and 350 pCi/L. The EPA has proposed a MCL of 300 pCi/L, which has not been finalized.

Radon is a radioactive gas that you can’t see, taste, or smell and is a known carcinogen. Compared to radon entering the home through soil, radon entering the home through tap water will, in most cases, be a small source of radon in indoor air. Breathing air containing radon can lead to lung cancer and/or drinking water containing radon also may cause increased risk of stomach cancer. If you are concerned about radon in your home, test the air in your home. Testing is inexpensive and easy. Fix your home if the level of
radon in your air is 4 picocuries per liter of air (pCi/L) or higher. There are simple ways to fix a radon problem that aren’t too costly. For additional information, call EPA’s Radon Hotline (1-800-577-2366) or access the EPA website at www.epa.gov/radon/radon-hotlines-and-information-resources.

**Arsenic:** The arsenic readings in 2019 at the Central and Well electric wells were 3.55 and 4.74 ppb respectively. The Maximum Contaminant Level (MCL) for Arsenic is 10 ppb.

City of Spokane drinking water currently meets EPA’s revised drinking water standard for arsenic. However, it does contain low levels of arsenic. EPA’s standard balances the current understanding of arsenic’s possible health effects against the cost of removing arsenic from drinking water. EPA continues to research the health effects of low levels of arsenic, which is known to cause cancer in humans at high concentrations and is linked to other health effects such as skin damage and circulatory problems. Information on arsenic in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline.

**Lead:** In-home testing for lead was performed in 2018. The City tested 56 at-risk residences for lead. The single highest result was 3.58 ppb. This result for lead is below the 15 ppb Action Level for lead. The lead results, based on City in-home sampling, also continue to qualify our water system as having “Optimized Corrosion Control”. Source water is analyzed for lead concurrent with the in-home testing. In 2018 the maximum concentration in the source water testing of all the wells for lead was 0.16 ppb.

All remaining known lead service lines in the City’s water system were replaced during a program from 2016 to 2018.

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The City of Spokane is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your drinking water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline, 1-800-426-4791 or at www.epa.gov/your-drinking-water/basic-information-about-lead-drinking-water.

**CITY OF SPOKANE’S SYSTEM**

All of the City of Spokane’s drinking water comes from the Spokane Valley-Rathdrum Prairie (SVRP) Aquifer - designated a “sole source” aquifer in 1978. The Spokane Aquifer (that portion of the SVRP aquifer lying within Washington State) and the Spokane River exchange water. The rates and locations of exchange are the subject of continued study.

Due to the porous nature of the ground surface and the number of potential contaminant sources, the possibility of contaminating the aquifer exists if good “housekeeping” measures are not followed for all activity over and adjacent to the aquifer. In order to safeguard water quality, the City, in coordination with other stakeholders, is currently implementing a Wellhead Protection Program. This program endeavors to inform the public about the Spokane Valley-Rathdrum Prairie Aquifer, and about appropriate disposal mechanisms for dangerous and/or critical materials that are generated in the Aquifer Sensitive Area. The program is advocating land use regulations to help protect drinking water wells from contamination.

For additional information regarding the City of Spokane’s Drinking Water or related issues, you can call:

City of Spokane Water & Hydroelectric Services 509-625-7800

The Mayor recommends Water and Hydroelectric Services policy and rates to the Spokane City Council. The Council meets most Mondays at 6:00 p.m. in the Council Chambers at Spokane City Hall (808 W. Spokane Falls Blvd., Spokane, WA).

### Notes
- Compliance with MCL is determined by single sample results, so no average is used.
- Gross Alpha results were used in lieu of Radium 226, one half of the detection limit of 1.0 was used for the ND
- Faucet samples were from ‘at risk’ homes (those with lead service lines and those with copper pipes with lead solder joints).
- 90% of at-risk homes had this concentration, or less, of lead/copper.
- Unregulated contaminant monitoring helps EPA to determine where certain contaminants occur and whether the Agency should consider regulating those contaminants in the future.

### Key to Table
- AL = Action Level = The concentration of a contaminant when it exceeds, triggers treatment or other requirements when a water system must follow.
- LRAA = Locational Running Annual Average
- MCL = Maximum Contaminant Level = The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.
- MCLG = Maximum Contaminant Level Goal = The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.
- pCi/L = Picocuries per liter (a measure of radioactivity)
